Q: Polynomial automorphism of affine variety Let $f: k[x_0, \dots, x_n] \rightarrow k[x_0, \dots, x_n]$ be an automorphism. Suppose k is algebraically closed. Denote the ideal of k^n generated by $f(x_0), \dots, f(x_n)$ by I_f . And denote the affine scheme of k^n by $\text{Spec}(k[x_0, \dots, x_n])$ and the degree of f by d . Let V be the affine variety defined by the ideal I_f . Now, by the theory of algebraic sets, f induces a bijection $f: V(k) \rightarrow V(k)$. If f is defined by $f(x_i) = \sum a_{i,j} x_j$, then f is said to be polynomial automorphism of affine variety V . I am wondering how to determine the degree d of f from only I_f . I know that it cannot be 1, since a constant polynomial cannot be polynomial. But I can only see d cannot be greater than 1 from its general form. I see the relation between the degree d and the degree of f I have. But I don't know how to find the degree d and have not much ideas in finding it. A: When you are thinking about degree you should always use the term in $k[x_0, \dots, x_n]$. For instance $f(x_i) = \sum a_{i,j} x_j$ means the coordinate ring is $k[x_0, \dots, x_n]$.
